SMI Reaches Five-Year Milestone of Partnership with Boeing Airplane Health Management (AHM)

SMI has reached the first five-year milestone of a successful partnership with Boeing Commercial Aviation Services in its Airplane Health Management (AHM) decision support capability.

The AHM capability, provided via the MyBoeingFleet.com portal, uses real-time airplane data to reduce schedule interruptions and increase maintenance and operational efficiency. It delivers valuable information when and where it is needed (Ref.: http://www.boeing.com/commercial/ams/mss/brochures/airplane_health.html).

SMI's trend monitoring and alerting software *iTrend*[®] is included in Boeing AHM as an application library to support the data analysis, charting, and alert generation functions. The *iTrend*[®] library has been tailored for the AHM environment with specific interfaces to facilitate integration. The library is based on the same open-system architecture of *iTrend*[®] to provide scalable monitoring of all types of industrial equipment or systems.
